Skew shapes and the Littlewood-Richardson rule

Let $n \in \mathbb{Z}_{>0}$.

A lattice permutation is a word

$$p = \boxed{i_1} \otimes \dots \otimes \boxed{i_n} \in B(\square)^{\otimes k}$$

such that if $r \in \{1, \dots, k\}$ and $j \in \{1, \dots, n\}$, then

$$\#(\boxed{j} \text{ in } \boxed{i_1} \otimes \dots \otimes \boxed{i_r})$$

$$\geq \#(\boxed{j+1} \text{ in } \boxed{i_1} \otimes \dots \otimes \boxed{i_r})$$

$$\text{where } B(\square) = (\boxed{1} \xrightarrow{1} \boxed{2} \rightarrow \dots \xrightarrow{n-1} \boxed{n})$$

Theorem A word p is a lattice permutation iff p is a highest weight element of $B(\square)^{\otimes k}$.

Skew shapes

Let $\lambda = (\lambda_1, \dots, \lambda_n) \in \mathbb{Z}_{\geq 0}^n$ and $\mu = (\mu_1, \dots, \mu_n) \in \mathbb{Z}_{\geq 0}^n$ be partitions. Assume $\mu \leq \lambda$ as boxes.

$$\lambda / \mu = \left\{ \begin{array}{l} \text{boxes in } \lambda \text{ that are} \\ \text{not in } \mu \end{array} \right\}$$

Examples

// $\lambda = (2 \ 2 \ 1)$ and $\mu = (1 \ 1 \ 0)$, then

$$\lambda = \begin{array}{|c|c|} \hline \square & \square \\ \hline \square & \square \\ \hline \square & \\ \hline \end{array} \quad \text{and} \quad \mu = \begin{array}{|c|} \hline \square \\ \hline \square \\ \hline \end{array} \quad \text{and} \quad \lambda/\mu = \begin{array}{|c|c|} \hline \square & \square \\ \hline \square & \\ \hline \square & \\ \hline \end{array}$$

// $\lambda = (2 \ 2 \ 0)$ and $\mu = (1 \ 0 \ 0)$, then

$$\lambda = \begin{array}{|c|c|} \hline \square & \square \\ \hline \square & \square \\ \hline \end{array} \quad \text{and} \quad \mu = \begin{array}{|c|} \hline \square \\ \hline \end{array} \quad \text{and} \quad \lambda/\mu = \begin{array}{|c|c|} \hline \square & \square \\ \hline \square & \square \\ \hline \end{array}$$

A SSYT of shape λ/μ filled from $\{1, \dots, n\}$ is a function $T: \lambda/\mu \rightarrow \{1, \dots, n\}$ such that

(a) // $(r, c), (r, c+1) \in \lambda/\mu$, then $T(r, c) \leq T(r, c+1)$

(b) // $(r, c), (r+1, c) \in \lambda/\mu$, then $T(r, c) < T(r+1, c)$

Let $B(\lambda/\mu) = \{ \text{SSYT of shape } \lambda/\mu \text{ filled from } \{1, \dots, n\} \}$

Example $n=3$

$$B\left(\frac{(2 \ 2 \ 0)}{(1 \ 0 \ 0)}\right) = B\left(\begin{array}{|c|c|} \hline \square & \square \\ \hline \square & \square \\ \hline \end{array}\right)$$

$$= \left\{ \begin{array}{|c|c|} \hline & 1 \\ \hline 1 & 2 \\ \hline & 1 \\ \hline 1 & 3 \\ \hline \end{array}, \begin{array}{|c|c|} \hline & 1 \\ \hline 2 & 2 \\ \hline & 2 \\ \hline 1 & 3 \\ \hline \end{array}, \begin{array}{|c|c|} \hline & 1 \\ \hline 2 & 3 \\ \hline & 2 \\ \hline 2 & 3 \\ \hline \end{array}, \begin{array}{|c|c|} \hline & 1 \\ \hline 3 & 3 \\ \hline & 2 \\ \hline 3 & 3 \\ \hline \end{array} \right\}$$

Note: $\lambda = \lambda/\phi$, and so we are generalising our previous ideas.

Theorem There exists a unique crystal structure $(wt \text{ and } \tilde{f}_1, \dots, \tilde{f}_{n-1})$ such that

$$B(\lambda/\mu) \hookrightarrow B(\square)^{\otimes k}$$

$$T \longmapsto \begin{array}{c} \text{arabic reading} \\ \text{of } T \end{array}$$

is a crystal morphism.

For example:

$$B(\square) = \left\{ \begin{array}{ccc} \begin{array}{|c|} \hline 1 \\ \hline \end{array} & \xrightarrow{\tilde{f}_1} & \begin{array}{|c|} \hline 1 \\ \hline \end{array} \\ \begin{array}{|c|} \hline 2 \\ \hline \end{array} & & \begin{array}{|c|} \hline 2 \\ \hline \end{array} \\ \hline \begin{array}{|c|} \hline 1 \\ \hline \end{array} & \xrightarrow{\tilde{f}_2} & \begin{array}{|c|} \hline 2 \\ \hline \end{array} \\ \begin{array}{|c|} \hline 3 \\ \hline \end{array} & & \begin{array}{|c|} \hline 3 \\ \hline \end{array} \\ \hline \begin{array}{|c|} \hline 1 \\ \hline \end{array} & \xrightarrow{\tilde{f}_1} & \begin{array}{|c|} \hline 2 \\ \hline \end{array} \\ \begin{array}{|c|} \hline 3 \\ \hline \end{array} & & \begin{array}{|c|} \hline 3 \\ \hline \end{array} \\ \hline \begin{array}{|c|} \hline 2 \\ \hline \end{array} & \xrightarrow{\tilde{f}_2} & \begin{array}{|c|} \hline 2 \\ \hline \end{array} \\ \begin{array}{|c|} \hline 3 \\ \hline \end{array} & & \begin{array}{|c|} \hline 3 \\ \hline \end{array} \\ \hline \begin{array}{|c|} \hline 1 \\ \hline \end{array} & \xrightarrow{\tilde{f}_2} & \begin{array}{|c|} \hline 2 \\ \hline \end{array} \\ \begin{array}{|c|} \hline 3 \\ \hline \end{array} & & \begin{array}{|c|} \hline 3 \\ \hline \end{array} \end{array} \right\}$$

there are two highest weight vectors

$$\hookrightarrow \left\{ \begin{array}{ccc} \underline{1 \ 2 \ 1} & \xrightarrow{\tilde{f}_1} & 1 \ 2 \ 2 \\ \downarrow \tilde{f}_2 & & \downarrow \tilde{f}_2 \\ 1 \ 3 \ 1 & & 1 \ 3 \ 2 \xrightarrow{\tilde{f}_2} 1 \ 3 \ 3 \\ \downarrow \tilde{f}_1 & & \downarrow \tilde{f}_1 \\ 2 \ 3 \ 1 & \xrightarrow{\tilde{f}_2} & 2 \ 3 \ 2 \xrightarrow{\tilde{f}_2} 2 \ 3 \ 3 \end{array} \right\} \leq B(\square)^{\otimes 3}$$

Remark: Before $B(\lambda)$ was always irreducible. This is not true for $B(\lambda/\mu)$.

A Littlewood-Richardson filling of λ/μ is a SSYT of shape λ/μ filled from $\{1, 2, \dots, n\}$ such that the arabic reading word of T is a lattice permutation (now we know this is the same as being a highest weight element of $B(\square)^{\text{ok}}$; they didn't know this).

The skew Schur function $s_{\lambda/\mu}$ is

$$s_{\lambda/\mu} = \text{char}(B(\lambda/\mu)).$$

Corollary (of yesterday)

$$s_{\lambda/\mu} = \sum_{p \in B(\lambda/\mu)^+} \text{wt}(p).$$

For example,

$$s_{\begin{smallmatrix} \square & \square \\ \square & \end{smallmatrix}} = s_{\begin{smallmatrix} \square & \square \\ \square & \end{smallmatrix}} + s_{\begin{smallmatrix} \square & \square \\ \square & \end{smallmatrix}}.$$

For a partition $v = (v_1, \dots, v_n) \in \mathbb{Z}_{\geq 0}^n$ such that $v_1 \geq \dots \geq v_n$, define

$$B(\lambda/\mu)^+_v = \left\{ \begin{array}{l} \text{highest weight elements of} \\ p \in B(\lambda/\mu) \text{ with } \text{wt}(p) = v \end{array} \right\}$$

From here, we define the Littlewood-Richardson coefficients:

$$c_{\mu\nu}^{\lambda} = \text{card}(B(\lambda/\mu)^+_v).$$

Then,

$$S_{\lambda/\mu} = \sum_{p \in B(\lambda/\mu)^+} \text{Swk}(p) = \sum_v \sum_{p \in B(\lambda/\mu)^+_v} \text{Swk}(p)$$

$$= \sum_v \sum_{p \in B(\lambda/\mu)^+_v} S_v$$

$$= \sum_v c_{\mu v}^{\lambda} S_v$$

Example If $\lambda = (2, 2, 0)$ and $\mu = (1, 0, 0)$, then

$$\lambda/\mu = \begin{array}{|c|c|} \hline & \square \\ \hline \square & \square \\ \hline \end{array} \quad \text{and} \quad c_{\mu v}^{\lambda} = \begin{cases} 1, & \text{if } v = \begin{array}{|c|} \hline \square \\ \hline \end{array} \\ 0, & \text{otherwise} \end{cases}$$

If $\lambda = (2, 2, 1)$ and $\mu = (1, 1, 0)$, then

$$\lambda/\mu = \begin{array}{|c|c|} \hline & \square \\ \hline & \square \\ \hline \square & \\ \hline \end{array} \quad \text{and} \quad c_{\mu v}^{\lambda} = \begin{cases} 1, & \text{if } v = \begin{array}{|c|} \hline \square \\ \hline \end{array} \\ 1, & \text{if } v = \begin{array}{|c|} \hline \square \\ \hline \square \\ \hline \end{array} \\ 0, & \text{otherwise.} \end{cases}$$
